Gear Pumps Replaced

Old Gear Pumps replaced by reliable alternative

ISSUE

A leading potato and chip processor operated two old gear pumps on their fats recovery system. These pumps had proved troublesome over the years, and when the manufacturer discontinued this range, it became an ideal opportunity to look at engineering out the problems associated with regular pump failures.

SOLUTION

Eriks Pump Technology reviewed the application and recommended the use of a Varisco self-priming pump. These pumps have become a firm favourite of this site, in use on a multitude of applications elsewhere.

The Varisco pumps have proved more than capable of handling the debris often found to be the cause of failure of the previous pumps, and in terms of initial purchasing costs, are significantly more cost effective.

OTHER BENEFITS

- By standardising on a single model Varisco pump across the site, this manufacturer has significantly reduced the number of differing types and styles of pump required to cover a number of differing applications.

FURTHER COMMENTS...

This application is an excellent example of how Erik's Pump Technology look at applications and advise on the correct product for the job. We often find many applications where incorrectly specified pumps have been selected and give clients on going issues over the years.
