

Maximise your team's potential

Situation

A quarry was struggling with frequent breakdowns and poor machine efficiency. On top of this, maintenance activities were taking an unnecessarily large amount of time, resulting in long periods of unplanned downtime, high maintenance costs and significant lost production.

Solution

A training needs analysis identified serious gaps in the training of maintenance personnel, which was not only causing the large amounts of downtime, but directly contributed to the original machine problems.

The company invested in **SKF training** courses for their maintenance staff. The broad range of training courses available covers everything from basic bearing fitting and maintenance, through to advanced troubleshooting and accredited vibration analysis qualifications.

SKF training courses are conducted by staff with years of practical, hands-on experience, and can either be held at the company's own location, or at one of SKF's training centres.

With a properly trained maintenance team, the quarry saw a significant increase in machine reliability and efficiency, and reduced maintenance costs and downtime.

The SKF logo, consisting of the letters 'SKF' in white on a blue rectangular background with a red horizontal line below it.
