

# PROBLEM SOLVER

## GUARANTEED HOT WATER SUPPLY WITH TLV HEATPACK

# TLV<sup>®</sup>

**Problem:** Every food and beverage manufacturer has to undertake wash-downs to ensure their product remains free from contamination. One confectioner was finding that their steam heating system was unable to produce hot water fast enough to meet the demands of a complete plant wash-down on a Friday, despite having a 2000 gallon storage tank – an issue which only got worse during periods of high demand.

**Solution:** HeatPack by TLV is a packaged heat exchanger designed to provide an instant supply of high volume hot water on demand at a constant 65°C. This meant that the confectioner could not only cope with the water demands of a wash-down but they also no longer need to store large volumes of hot water for the rest of the week in their 2000 gallon storage tank.
