

PROBLEM SOLVER

THEY'RE NOT BIG ... BUT THEY ARE CLEVER

Problem: After undertaking research with professional technicians, Carl Kammerling identified that over 85% of them carry a non-insulated stubby screwdriver. Despite understanding the importance of using insulated tools, they were putting their lives at risk when working with electricity in confined spaces, there was simply no other solution when their usual VDE screwdrivers would not fit.

Solution: The **C.K Stubby VDE Slim Screwdrivers** filled this gap in the market perfectly, by featuring a shorter length (ideal for use in confined spaces) and full VDE approval, providing the assurance that each product is individually tested to 10,000V for safe working up to 1,000V. The Slim shafted insulated blades allow access to recessed screws and fixings and their short length makes them ideal for use in confined spaces. The set has 4 tip types that cover the majority of requirements and are made from premium quality chrome vanadium steel which are 100% German manufactured to ensure exceptional quality, strength and durability.
