## **PROBLEM SOLVER**

## KEEPING EVERYTHING SEALED TIGHT

## LOCTITE

**Problem:** Even the smallest of leaks in hydraulic and pneumatic systems can cause appalling damage, so adequate protection against this potential problem is a top priority for fluid technology manufacturers.

**Solution:** Dedicated thread-sealers provide a seal against fluids that are aggressive or supplied at high pressure. In a case example concerning hydraulic fittings, LOCTITE **577** came to the rescue of an injection moulding equipment manufacturer who was experiencing leaks as a result of using PTFE tape. A course thread-sealer was required to seal oil pressures of up to 10,000 psi (690 bar). With LOCTITE 577, a positive seal was obtained to prevent loosening through heat and/or vibration.
